

Project Design Phase-II

Customer Journey Map

GUIDED CUSTOMER JOURNEY MAP - AUTOMATED NETWORK REQUEST SYSTEM

The Guided Customer Journey Map highlights the critical operational evolution from a fragmented legacy intake process to a streamlined, automated ServiceNow ecosystem. In the initial phases (**Entice** and **Enter**), users frequently encountered confusing documentation and open text fields, which allowed human data entry typos to bypass verification loops and enter backend environments. By transitioning these stages to a central Service Portal using strict alphanumeric field constraints and gray placeholder annotations, the system blocks formatting anomalies directly at the point of ingestion, ensuring data integrity before any engineering resource is spent.

During the core execution milestones (**Engage** through **Extend**), low-code automation engine elements within Flow Designer eliminate the visibility vacuum and configuration rework loops that previously delayed delivery timelines. As the request shifts from automated manager sign-offs to physical deployment inside custom backend tracking tables (u_network_database), real-time stage-tracking headers keep the customer informed. This zero-touch approach slashes fulfillment latency tails and automatically commits every transaction parameter to immutable audit files, providing corporate compliance transparency while building a foundation for downstream orchestration hub integrations.
