

Project Design Phase

Problem – Solution Fit Template

Date	24 June 2026
Name:	Varsaa Vihasini S B
Project Name:	Automated Network Request Management System
Maximum Marks:	2 Marks

Define CS, fit into UC	1. CUSTOMER SEGMENT(S) [cite: CS] - Enterprise employees, etc.) - Network administrators (enterprises & network administrators)	6. CUSTOMER CONSTRAINTS [cite: CC] - Enterprise security rules in Enterprise security modifications - Time limitations for don't motivated - Time units heavy to revisional resources	5. AVAILABLE SOLUTIONS [cite: AS] - Manual emails in manual - Paper forms, another term affluriting - Paper forms, manual mural and communication aminds in paper forms	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS [cite: J&P] - Rapid network port requests. - Rapid network port request; on port requests. - Resource auditing for resource resource auditing.	9. PROBLEM ROOT CAUSE [cite: RC] - The lack of unified workflow systems in withint the critreal sesolutions problems. - Unsure customers to be cause the workflow systems and change in regulations.	7. BEHAVIOUR [cite: BE] - IT helpdesk flooding to address the problem and get jobs. - Self-diagnosis in transhivory. - Indirectly associated speed fomns on voluursweeking line (I Greenpeace)	
Focus on J&P, fit into BE, understand RC	3. TRIGGERS [cite: TR] - Corporate restructures and rendied hardware connectors. - Sudden hardware failures.	10. YOUR SOLUTION [cite: SL] - Automated self-service portal with automated workflow or with your connerctious system. - Asynchronous workflow with secures secures, and avenage will process integration. - Secure u_network_database integration and scammttoh to secures completer..	8. CHANNELS of BEHAVIOUR [cite: CH] 8.1 ONLINE - Online online #7 - Online channels #7 - Extract ontr:online channels from #7	Focus on J&P, fit into BE, understand RC
	4. EMOTIONS: BEFORE / AFTER [cite: EM] - Frustration > win face or a job, after-wards. - Lost, insecure > confident, in control it in connatration strategy act.	8.2 OFFLINE - Offline channels commor underforements. - Offline channels offline channelst and use customer development.		
Identify slwely TR & EM				Extract online & offline CH of BE

Problem-Solution Fit Analysis

1. Document Purpose & Strategic Alignment

The fundamental objective of this analysis is to establish a rigorous Problem-Solution Fit by mapping existing customer behavioral bottlenecks directly to automated system resolutions. By identifying the friction points within legacy infrastructure request cycles, this framework ensures that the engineered solution inherently coordinates with existing enterprise workflows, eliminates tracking dropouts, and drives rapid user adoption.

Entrepreneurs, marketers, and corporate innovators can leverage this analysis to understand target behavioral patterns, ensuring the solution solves frequent annoyances, urgent errors, and costly delivery bottlenecks.

2. Customer Friction & Solution Fit Analysis

❑ Friction Area 1: Long Request Turnaround Times (Frequent Annoyance)

Current Behavioral Pattern: Users are forced to manually compile complex network configuration vectors over fragmented email chains, offline spreadsheets, or local text documents.

Engineered Solution Fit: The system introduces a single point of ingestion via a custom Service Portal Catalog Item. This completely unifies the intake process into a structured corporate interface.

Trust & Adoption Trigger: It delivers immediate gratification by instantly converting request turnaround timelines from days or weeks down to automated hours.

❑ Friction Area 2: Data Transcription Errors & Syntax Typos (Urgent Problem)

Current Behavioral Pattern: Requesters regularly guess network schema limits, manually typing unverified alphanumeric variables, VLAN tags, or IP subnets into plain text blocks.

Engineered Solution Fit: The platform implements strict client-side validation using interactive UI Policies and Catalog Client Scripts that evaluate input syntax right at the moment of data entry.

Trust & Adoption Trigger: This builds user confidence by intercepting mistakes early, completely blocking broken data from moving downstream, and eliminating painful engineering rework cycles.

❑ Friction Area 3: Opaque Pipelines & Approvals (Costly Bottleneck)

Current Behavioral Pattern: Requesters spend hours sending repetitive chat messages or follow-up emails to assignment groups simply to figure out who currently owns the approval stake for their ticket.

Engineered Solution Fit: An asynchronous backend workflow engine running inside Flow Designer checks manager hierarchies through relational database lookup hooks.

Trust & Adoption Trigger: The application eliminates user uncertainty by introducing a real-time progress indicator bar at the top of the user dashboard, displaying status metrics instantly.

3. Core Capabilities Mapped to Target Expectations

❑ Solving Complex Ingestion Contexts

End-users are often overwhelmed by complicated technical specifications required for structural engineering requests, such as verifying active destination zones or

calculating subnet blocks. The application actively mitigates this cognitive load by replacing raw text descriptions with smart, context-aware form blocks. When the form loads, it dynamically checks the active session context (sys_user) to auto-populate employee names, corporate emails, and department metadata instantly, eliminating manual data entry.

❑ Tapping into Existing Channels of Behavior

Enterprise teams routinely push back against entirely isolated external tools because they require logging into standalone portals or remembering new credentials. The Automated Network Request Management System achieves frictionless organizational adoption by embedding directly into the enterprise's existing daily workspace. This allows engineers to track queues, approve requests, and resolve tasks from a centralized dashboard they already use.

❑ Building System Trust via Compliance and Audit Integrity

Regulatory compliance failures frequently occur when infrastructure changes are driven by informal verbal agreements or untracked communication channels. The platform builds rock-solid organizational trust by implementing platform-native audit capturing. Every time a ticket experiences a state alteration, a variable mutation, or a manager signature log event, the system automatically commits an immutable record to the historical tracking database stream (sys_audit). This provides comprehensive, tamper-proof accountability for security audits.

📊 4. Operational Value Realization Benchmarks

To confirm a successful Problem-Solution Fit upon production rollout, development squads will benchmark platform performance directly against the following metrics:

Operational Velocity: The transition from manual ingestion to structured workflows must drive a reduction in end-to-end processing timelines by **greater than 75%**.

Data Sanitization Baseline: Client-side form validation mechanisms must achieve a **0% transcription error rate** passing into backend tables.

Platform Scalability: The database structure must easily handle peak traffic demands, sustaining up to **10,000 concurrent records** simultaneously without causing query degradation.
